

C018 Light Detector Module

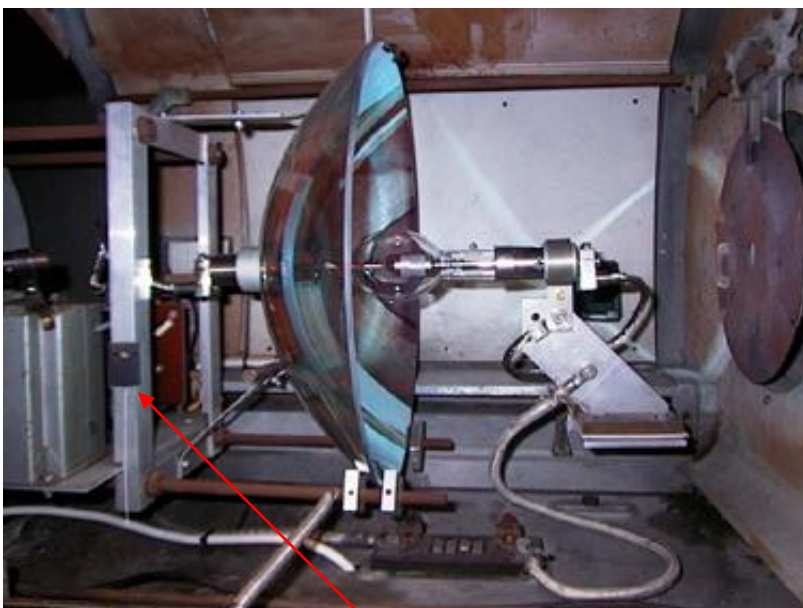

The C018 is a light detector module, fitted within the projector lamp housing, enabling constant monitoring of the projector Xenon lamp.

When introduced into Automation 2000 systems the module can switch an audible / visual alarm and initiate safe projector shutdown in the event of lamp failure.

The fully electronic unit has the advantage of sensing only visible light and eliminates the afterglow effects of the infrared generated by the Xenon lamp.

Actual size

C018 module mounted within lamp housing.

The C018 Light Detector Module is mounted within the projector lamp housing, minimal visible light is required and the module should be protected from direct infrared, which may degrade the optical system.
