

# C149 Function 15 module.

The C149, function 15 module has been developed to give additional functions to the Cinemation 2000 series Automation. The unit is easily retrofitted to the existing logic board and only requires connections to the sound control system.

- Interior function 15 now becomes available for sound format change.
- Function 10 has additional timer delay for tabs close.

Function 15 was previously an internal only operation but becomes available with the introduction of the new circuitry.

A two pole make / break 1 amp relay is now available when function 15 is selected.

Function 15 can be used for sound mute or sound format change by direct connection to Dolby systems.

Function 10 internal routine, now has an additional variable time delay (0-30s), which is controlled by the blue onboard potentiometer.

This time delay occurs immediately before all previous functions and is used to compensate for differing tab closing times.

This means that a standard time delay can be used for all screens in a location.

A film with automation pulses can then be moved from screen to screen without further change.

### EXAMPLE
